

Clinical-Grade Agentic AI for Faster, Cleaner Trials

EDETEK R&D Cloud Ecosystem

From fragmented clinical data to auditable, autonomous action

Why now, why EDETEK, and what the demo proves

The bottleneck is no longer data volume; it is decision latency.

Modern trials generate more signals across more systems, but many actions still depend on manual review, delayed escalation, and disconnected accountability.

01

Protocol + design complexity

DCT, hybrid, digital biomarkers, adaptive designs, RWD/RWE

02

Site and patient burden

Missed visits, delayed scheduling, retention risk, investigator fatigue

03

Data quality pressure

EDC, ePRO/eCOA, labs, safety, imaging, EHR/EMR, genomics

04

Compliance + audit expectations

RBQM, traceability, inspection readiness, controlled AI adoption

Result: rich clinical data exists, but the organization still reacts late.

Regulatory context: ICH E6(R3), FDA DHT guidance, FDA AI/ML discussion paper and RWD/RWE programs emphasize risk-based quality, technology-enabled evidence, and controlled innovation.

The shift: from restrictive platforms to an R&D Cloud Ecosystem

Best-in-class clinical systems, unified by semantic integration and event-driven orchestration

Siloed systems

EDC, CTMS, safety, lab, eCOA, EHR, imaging, genomics

R&D Cloud

Semantic data layer, multi-SSO, workflow orchestration, near real-time events

AI decision layer

Agents recommend, route, and document next best actions

EDETEK R&D Cloud differentiators

- Select specific functionality without locking sponsors into one platform
- Integrate clinical data sources and workflow events
- Reuse TA accelerators: metadata, checks, alerts, visualizations
- Support RBQM, analytics, and submission readiness

EDETEK's Differentiator: technology + services + therapeutic intelligence

A clinical AI company needs both software and the operational expertise to deploy it

R&D Cloud Ecosystem

Open, interoperable clinical data and workflow layer

Therapeutic accelerators

Therapeutic area libraries, metadata, rules, checks, dashboards

AI-enabled services

Clinical operations, data management, biostatistics, validation

Clinical-grade AI operating layer

Why this is different

- Open ecosystem instead of one-size-fits-all platform
- Clinical data and workflow context, not just a language model
- Therapeutic-area libraries: rules, metadata, checks, dashboards
- Services team to configure, validate, train, and scale
- Global footprint: founded 2009; 150+ biopharma clients across four continents

EDETEK can show the demo and then deploy it as a governed clinical workflow.

Agentic AI, made clinical-grade

Agents only create value when they can reason, act, and leave an inspection-ready trail

CONTROLLED ACTION LOOP

Guardrails:

role permissions | source traceability | human approval gates | audit logging | validation and monitoring

Controlled transitions from signal to decision to action

1

Detect

Visit data violates the protocol window

2

Explain

Agent cites patient, site, visit, source, and rule

3

Route

Recommended action becomes a task/query/alert

4

Record

Rationale, owner, timestamp, and status are audit-ready

detect | explain | route | record

Impact model: faster decisions without losing control

The pilot should measure value in operational terms, not generic AI enthusiasm

Time to detection

Hours instead of late-cycle review

Manual rework

Fewer low-value checks and follow-ups

Agentic protocol adherence

Data quality

Issues corrected before data locks

Patient retention

Earlier visit recovery and site coaching

Scorecard

time to detection | alert precision | deviation aging | analysis and reporting | audit trail completeness

EDETEK's R&D Cloud – Industry's most reliable Information Backbone

EDETEK R&D CLOUD: CONFORM™ INFORMATICS

End-to-end Business Functions Coverage

CONFORM™ Biometrics Applications (at least one application is required in Platform Subscription)

**Data Standardization
Package (DSP)**
SDTM production

**Data Analytics
Package (DAP)**
ADaM production

**Tables, Listings
and Figures (TLF)**
*Code and Report
Generator*

**Statistical Computing
Environment (SCE)**

Analytical Engine
SAS, R, Python

CONFORM™ Insights (CI)
*Engine and Repository of
Metrics, KRIs, Goals,
Milestones*

Information Quality (IQ)
*Data Cleaning,
Integrated Data Review,
Data Monitoring, Issue
Management, Quality
Assessment, Visualization*

Batch
*Business Rules
Execution Engine*

**Clinical Data
Warehouse**

CONFORM™ Data Ingestion, Integration and Metadata Management Applications (required in most Platform subscriptions)

**Information Hub
(iHub)**

**Integration Adapters
Library**

**Metadata
Repository (MDR)**

**Business Rules
Library**

CONFORM™ Foundation Applications (included in all Platform subscriptions)

**Platform
Management
(PM)**

**Administration
(ADM)**

**Study Information
Repository (SIR)**

**Clinical Data
Lake (CDL)**

**Events
Management
System (EMS)**

**Workflow
(WF)**

**Job Exec.
Management
(JEM)**

**Notification
Center
(NOC)**

User flow of SDTM production in DSP

Utilizing the MDR standard to Drive SDTM in DSP

Higher-level Design

SDTM programming specification-centered design

Common industry flow for SDTM production

User flow of ADaM production in DAP

Utilizing the ADaM transformation standard

User flow of TLF production in TLF Designer

Utilizing the TLF library

Overall Business Flow

BioStats.AI

Overall Business Design

Reusable clinical AI layer

The same foundation can support protocol adherence, safety, efficacy, RBQM, and study execution

01

Protocol adherence

Visit windows, eligibility, missed assessments

02

Safety + compliance

Anomalies, AE/SAE patterns, escalation

03

Efficacy + intervention

Risk signals, subgroup patterns, action triggers

Data foundation

EDC, CTMS, labs, safety, EHR, imaging, eCOA

Clinical knowledge

Protocol rules, TA metadata, ONCO+, data checks

Agent orchestration

Reasoning, tools, memory, workflow policies

Governed actions

Alerts, tasks, queries, analysis, insights, narratives

Reusable assets deliver exponential efficiency: data integrations, protocol logic, TA rules, validation evidence, and workflow patterns.

Pilot – Validate - Scale

Start with one major pain point; validate the evidence; scale only after governance is proven

EDETEK services layer

Clinical operations | data management | biostatistics | validation/CSV | change management

Governance posture

Start human-in-the-loop; move to human-on-the-loop only after measured reliability, SOP fit, and audit evidence.

The takeaway

**EDETEK connects the data.
Agents accelerate the action.
Services make it deployable.**

Recommended next step

Choose one high-friction protocol or compliance workflow, provide live or representative datasets, and evaluate against the pilot scorecard

THANK YOU

Q&A / demo follow-up

Discuss fit for:

- Statistical analysis and reporting
- Protocol adherence
- Safety monitoring
- RBQM and data review
- TA accelerator deployment

www.edetek.com

Appendix: regulated AI control checklist

The governance model should be visible before clinical teams trust autonomous workflows

Validated data access

Role-based access, source lineage, PHI controls

Bounded autonomy

What the agent can recommend vs. execute

Human approval gates

Escalation thresholds and sign-off workflows

Audit-ready evidence

Reasoning summary, source, rule, owner, timestamp

Performance monitoring

Precision, drift, override rate, recurring failure modes

SOP + validation alignment

CSV/CSA, training, change control, release governance

Core message: clinical AI should be inspected like a workflow, not merely evaluated like a model.

Appendix: use-case library for follow-up workshops

Examples that reuse the same R&D Cloud and agentic AI foundation

Protocol adherence

Missed visits, eligibility, out-of-window assessments, deviation routing

Efficacy + intervention

Early signals, subgroup patterns, site coaching, patient-level risk flags

Data management

Missing data, edit check optimization, query triage, lock readiness

Safety monitoring

AE/SAE patterns, anomaly detection, escalation and intervention workflows

RBQM and site performance

KRIs, QTLs, monitoring prioritization, capacity planning

Biostatistics and analytics

BioStat.AI support for analysis planning, review, and narratives
